MINNESOTA – CLIMATE

<https://www.britannica.com/place/Minnesota/Climate>

The climate of Minnesota is typical of a continental climate, with hot summers and cold winters. Minnesota's location in the Upper Midwest allows it to experience some of the widest variety of weather in the United States, with each of the four seasons having its own distinct characteristics. The areas near Lake Superior in the Minnesota Arrowhead region experience weather unique from the rest of the state. The moderating effect of Lake Superior keeps the surrounding area relatively cooler in the summer and relatively warmer in the winter, giving that region a smaller yearly temperature range. On the Köppen climate classification, the southern third of Minnesota—roughly from the Twin Cities region southward—falls in the hot summer humid continental climate zone (*Dfa*), and the northern two-thirds of Minnesota falls in the warm summer humid continental climate zone (*Dfb*). In summer, heat and humidity predominate in the south, while warm and less humid conditions are generally present in the north. These humid conditions help kick off thunderstorm activity 30–40 days per year. Summer high temperatures in Minnesota average in the mid-80s F (30 °C) in the south to the upper-70s F (25 °C) in the north, with temperatures as hot as 114 °F (46 °C) possible. The growing season in Minnesota varies from 90 days per year in the Iron Range to 160 days in southeast Minnesota. Tornadoes are possible in Minnesota from March through November, but the peak tornado month is June, followed by July, May, and August. The state averages 27 tornadoes per year. Minnesota is the driest state in the Midwest. Average annual precipitation across the state ranges from around 35 inches in the southeast to 20 inches in the northwest.

MAJOR CITIES:

Middle Minnesota	St Cloud
West Minnesota	Moorhead
East Minnesota	Minneapolis / St Paul, Duluth
South Minnesota	Albert Lea
